Hi Chris,

We have reviewed the API endpoint requirements and documented our understanding and expectations below. Please let us know if our understanding and proposed approach looks

API Name	API Endpoint	Headers	API Request Payload
Application list / review queue	GET /api/v1/applications/status?startDateTime={startDate}&endDateTime={endDate}	{ Authorization: Bearer <Identity Token>, X-Source-Channel: visakey}	{ startDate: "10-06-2026", endDate: "10-06-2026"}
Application detail / recommendation	GET /api/v1/app_decision/{id}/details	{ Authorization: Bearer <Identity Token>, X-Source-Channel: visakey, X-Request-ID: <application_id>}	{'dis_application_id'}
Glass Box decision trail (Drools + OPA results)	GET /api/v1/rules_evaluations/{id}/ details	{ Authorization: Bearer <Identity Token>, X-Source-Channel: visakey, X-Request-ID: <application_id>}	{'dis_application_id'}
Documents + extractions	GET /api/v1/doc_processing/{id}/ details	{ Authorization: Bearer <Identity Token>, X-Source-Channel: visakey, X-Request-ID: <application_id>}	{'dis_application_id'}
External checks	GET /api/v1/external_checks/{id}/ details	{ Authorization: Bearer <Identity Token>, X-Source-Channel: visakey, X-Request-ID: <application_id>}	{'dis_application_id'}

Suggested Approach:

We have implemented the GET /api/v1/applications/{id}/status endpoint to retrieve all application-related details for a specific ID in a single API call. From the UI perspective, this enables the appropriate UI components.

- **Single API call reduces network overhead:** Fetching all application-related details in one request minimizes multiple API calls from the UI, resulting in better performance and reduced latency.
- **Simpler UI integration:** The UI can consume a single consolidated response and map relevant JSON sections directly to the appropriate UI components, making frontend integration easier.
- **Improved consistency of data:** Since all details are retrieved together, the UI receives synchronized and consistent application data, avoiding mismatches that can occur with multiple calls.
- **Better scalability and maintainability:** Centralizing application status and related details in one endpoint simplifies future enhancements, as additional fields or sections can be added without changing the UI logic.

Looking forward for your inputs here.

Subject: [EXT] Subject: Re: Read API Endpoints — Two Asks for the 17th

Hi Nishit,

Thank you for Thursday's response and for pushing the code to main.

Two asks for the 17th:

1. Confirmed delivery dates for the 5 read endpoints — not just a spec review, but completion dates we can plan against.
2. Draft API contracts (endpoint paths, request/response shapes, query parameters) so we can build the integration layer in parallel.

Isabela has requested a unified WBS covering all remaining work through 26 June for a Tuesday review meeting. The above feeds directly into that.
